## **EVENT DETAILS:**

### **Positive, practical solutions for the most challenging behavior problems**

Living with a dog exhibiting fearful, reactive or aggressive behavior can be heartbreaking. It can leave pet owners with little to no hope of sharing a peaceful life with their canine companions. This two day seminar introduces a new innovative training methodology designed for the most challenging behavior problems faced by pet owners.

TACT, Touch Associated Clicker Training creatively combines the science and art of learning theory, clicker training and massage therapy. This unique approach is used specifically to rehabilitate and prevent shy, fearful, reactive, and aggressive behavior in dogs and puppies utilizing positive training methods.

TACT utilizes a ritualized protocol designed with safety, structure and predictability. TACT develops confidence and coping skills while changing the emotional response in fearful dogs. TACT incorporates a detailed home management and real world exposure control program for owners to follow to coincide with their training

protocol. TACT is beneficial for all dogs, including puppies, shy dogs, and shelter dogs.

Both pet owners and experienced trainers will learn how to use the TACT program to:

Desensitize a dog's fear of people and new environments

Build confidence and coping skills, while changing the emotional response in fearful dogs

Provide structure, bringing predictability to the dog's life

Develop and deepen the canine/human relationship

Recognize canine body language and how to use this knowledge to set their dog up for success to maximize training results

Implement an effective home and real world management program

Develop a two way communication system between dog and handler

Enlist pet owners to become part of the solution in a creative and fun way

An effective tool in the canine professional's behavior modification toolbox

TACT's Caregivers Fatigue program provides a plan for healthy self care

Whether you are a canine professional or a pet owner this seminar will provide valuable information to add to your training toolbox.

The seminar will include some live dog demos. Due to our live demos, participant's dogs are not allowed inside the building. Weather permitting, participants are allowed to have their dogs crated in their vehicles in the parking lot.

We will be emailing registered attendees asking for individuals who may be interested in having their dog participate in our live demos for this event.

Registration is required prior to the seminar. Please contact the Seminar Host location for registration and pricing details.
